The simple and searches a novel genetically modified glucocofficions and is transactivation deficient. The invention also describes (1) a gene construct comprising at least a nucleic acid encoding the glucocorticoid receptor, operably linked with regulatory sequences of a reporter gene, preferably a DNA-binding domain for a reporter gene; (2) identifying a gene encoding a cofactor involved in glucocorticoid receptor modulation of at least another transcription factor comprising; (a) using the above construct with an expression bank of a eukaryotic cell expressed in a yeast two hybrid system; (b) detecting a specific protein-protein complex control exceptor and a cofactor through growth in a selective medium for the reporter and (c) isolating and characterising the nucleic acid characteristic for the glucocorticoid receptor with a cofactor in the cDNA clone; (3) a cofactor with control exceptors are bound; (4) identifying an agent which affects the reciprocal effect of the glucocorticoid receptor with other transcription achieves a reciprocal effect of the glucocorticoid receptor with other transcription factors and/or cofactors, whereby the receptor with other transcription creciprocal effect of the glucocorticoid receptor or construct is contacted with a potential agent and modulation of the interaction of the protein complex binding; (5) an agent for modulating interaction of the glucocorticoid receptor with a cofactor which binds either at the binding site of a physical lormone or at a separate binding place or detecting and (6) a compound with an inflammation-inhibiting or immunosuppressive receptors are used constructed receptors is used transcription or is useful to identify coreceptors when transmined the construction of effect comprising the above agent. The genetically modified the provence of the response or at a separate binding place of a physical permentation of the interaction of effect comprising the above agent. The genetically receptor is used transcriptors where the parament of the provence or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to produce an inflammation-inhibiting or immunosuppressive treatment.
This sequence represents a PCR primer #198rev used to amplify a Renilla reniformis luciferase gene which is then cloned into a reporter construct behind a ubiquitin promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A genetically modified glucocorticoid receptor which is transactivation deficient is used to identify cofactors which will be useful to provide inflammation-inhibiting and immunosuppressive treatment.
                                                                                                                                                                                                                                                            Luciferase, ubiquitin promoter, glucocorticoid receptor, PCR; primer, transrepression protein-protein reciprocal effect; immunosuppressive, transactivation deficient inflammation; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel genetically modified glucocorticoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Boettlicher M, Heilbock C, Herrlich P, Litfin M, Schneider S;
                                                                                                                                                                                                                    Renilla luciferase associated PCR primer #198rev.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (GESL ) FORSCHUNGSZENTRUM KARLSRUHE GMBH.

The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactor 6 (TRIE6) to inhibit its expression. TRIP6 is also known as OPA-interacting protein-1 (OID-1) and zyxin-related protein-1 (CRP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperproliferative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various amembers of a biological pathway. The are also useful in antisense therapy. The present sequence is human TRIP6 DNA specific PCR probe, used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides targeted to nucleic acids encoding thyroid hormone receptor interactor 6, useful for diagnosing or treating hyperproliferative disorders, such as cancer.
                                                                                                                                                                                                                                                                         Human; antisense; thyroid hormone receptor interactor 6; TRIP6; tumour; OPA-interacting protein-1; OIP-1; zyxin-related protein-1; prophylaxis; inflammation; therapy; hyperproliferative disorder; infection; cancer; chromosome 7q22; ZRP-1; PCR; probe; ss.

The invention relates to systems for identification and characterisation of gene expression in one or more samples, comprising an identimer having a specific oligo-dr primer sequence, where the identimer comprises a detectable marker at its 5' end. The system is useful for identifying any correctable marker at its 5' end. The system is useful for identifying any correctable marker at its 5' end. The system is useful for identifying any set the relative differences in mRNA between 2 or more sample, as well as the relative difference in mRNA between 2 or more samples. Where the desired, for supporting discovery of new genes, and for identifying mRNA system or method addresses limitations of prior methods by comprising compositions and systems that incorporate new strategies where molecular compositions and systems that incorporate new strategies where molecular expression. The system has the following advantages over existing expression. The system has the following advantages over existing nethods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information construction divides in mRNA level, to determine mRNA expression level and mRNA identification in many assay; (c) generates cDNA fragment from all mRNAs present in the sample for subsequent investigation by common molecular biology techniques; and (d) does not require prior knowledge of the sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        organisms lacking significant genomic sequence in formation. The present sequence represents an oligo dT primer used in the method of the

a specific oligo-dr primer sequence, where the identimer comprises a specific oligo-dr primer sequence, where the identimer comprises a detectable marker at its 5' end. The system is useful for identifying any or all genes expressed in a given in vivo or in vitro RNA sample, as well as the relative differences in mRNA between 2 or more samples, where that are expressed at different levels between 2 or more samples, where that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising compositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene compositions and systems and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene corpression. The system has the following advantages over existing methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information concerning changes or differences in many level, to determine mRNA expression level and mRNA identification in one assay; (c) generates CDNA expression level and mRNA identification in many level, to determine mRNA expression level and mRNA identification in earlier sequence in formation in determine mRNA expression level and mRNA identification conforming addition and can be employed in companies and (d) does not require prior knowledge of the sequence of the genome of the organism under investigation and can be employed in companies. The invention relates to systems for identification and characterisation Identifying and characterizing gene expression in samples, for identifying mRNAs expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end. sequence represents an oligo dT primer used in the method of the Oligo dT primer #1 used in method to study gene expression. reverse transcription and amplification, used to screen for new genes and interacting proteins, potential drugs, and for diagnosis. Preparation of normalised, subdivided cDNA libraries from mRNA - by WPI; 1999-009772/01.

Example 1; Page 29; 71pp; English.

The invention relates to preparation of a normalised, subdivided library of amplified cDNA from the coding regions of mRNA in a sample. The method involves reverse transcription, with at least one cDNA primer of formula 5'-Conl-dTn2-Vn3-Nn4 to form first strand cDNA where COnl = any sequence of 1-100 nucleotides; of = deoxythymidiny!; n2 is at least 1; n3 and n4 are both 0, or n3 is 1 and n4 is at least 1; followed by second strand cDNA synthesis using the first strand as template and a second cDNA primers Comparation of Gouble-stranded by second cDNA primers of as similar formula, in the presence of DNA polymerase I (or its Klenow fragment) and amplification of Gouble-stranded cDNA with a set of antendase (a computer-generated list of molecular weights of restricted DNA fragments of known sequence) is used to determine presence of an carpassed protein in a cell, also to detect changes in such expression (particularly for diagnosis of disease). Surfaces (chip) having amplified condition the presence of an careen for genes of a particular family, by hybridisation with nucleic acid from the family (to identify new genes) and to detect differences in expression patterns between cells. The polypeptides expressed by the libraries can be used for dray development. Sequences by the libraries can be used for drug development. Sequences AAV11935 to AAV71946 represent primers used to exemplify the method of the invention

The method comprises providing a nucleic acid sequence which is initially catalytically inactive, but which becomes catalytically antitive in the effector); providing a nucleic acid substrate for presence of an analyte (the effector); providing a nucleic acid substrate for the catalytic activity of the nucleic acid sequence and the substrate with the sample under.

Conditions allowing catalytic activity of nucleic acid sequences. The conditions allowing catalytic activity of nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid sequence will be able to convert the nucleic acid catalytic product if the analyte of interest is ubstrate intro a nucleic acid product only if the analyte of interest is significant increase in the amount of product is then amplified, and a significant increase in the amount of product indicates the presence of significant increase in the amount of product indicates the presence of significant increase in the method is useful for the qualitative or quantitative determination of an analyte in a sample in diagnostic assays. The invention describes the in vitro selection of a ribozyme ligase was selected from a pool of RNA molecules comprising a central randomised regions (the N90 RNA pool; AAA57851). In the presence of the effector, selection 90 nucleotides in length flanked on both sides by constant sequence regions (the N90 RNA pool; AAA57851). In the presence of the effector and a bNA primer identical in sequence to the substrate used for the selection. A ribozyme ligase, L1, was selected via this procedure. L1 can only adopt its active conformation (AAA57869) and then PCR amplified using the effector oligo (analyte). In the absence of the effector, L1 adopts an inactive conformation (AAA57860). The present sequence regioned usplanted using the present sequence is not given in the specification, but present 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting an analyte in a sample comprises providing nucleic acid sequence which is catalytically active in presence of analyte, contacting catalytic nucleic acid with substrate and amplifying catalytic product.
                                                                                                                                                                                                                                                                                                                                                                                                  /*tag= b

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new method for detecting minority genomes, present at less than 50%, in a population of nucleic acids of a viral quasal-species and having at least one mutetion with respect to the majority genome. The invention can be used for genetic diagnosis of viral infections, especially human immune deficiency virus and hepatitis B or failure of antiviral therapy so the method may make possible design of therapies customised for individual patients. The present nucleic acid sequence represents the VIH-MUT-12 DNA sequence that was used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting minority genomes in viral quasi-species, useful for identifying mutants responsible for drug resistance and to individualize therapy.

The invention relates to a mammalian PGI gene and protein, and a set of PGI biallelic markers. The PGI polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PGI-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) coasse. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence exxemplified the primer of the invention, and is used to sequence Incyte clone 1 (AAV42737). The primer of the invention is labelled with a set of at least 2 different fluorescent labels. The set comprises an energy-transfer fluorescent label with at least 1 each of a donor fluorophore and an acceptor fluorophore capable of energy transfer, and separated by a distance x, and a second similar fluorescent label in which the separation distance is y, x and y being sufficiently different for the two fluorescent labels to produce distinct fluorescent signals. Fluorescent labels are useful in multicomponent analyses, e.g. as probes for fluorescent in situ hybridisation or especially as primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Set of energy-transfer fluorescent labels with donor and acceptor at different separations – useful for DNA sequencing allows use of fewer analysing wavelengths or an increased throughput.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The parent discloses nover nument problemics to the parent discloses nover numen problemics and its corresponding protein. Zeycoris year to identify modulators (e.g. agoniets or antagonists). Zeycoris, its agoniets or antagonists are useful in the treatment of inflammation, the agonists or antagonists are useful in the treatment of inflammation during or cardiovascular conditions, muscle inflammation, inflammation during and after surgery, arthritis, asthma, inflammation, inflammation during and after surgery, arthritis, asthma, inflammation, one disease or diverticulitis, for modulating spermatogenesis, sperm capacitation, as immunocontraceptive or anti-fertility vaccine and for treating male infertility. Zeytori3 protein and its antibodies are used to diagnose cancer, repertivation ischaemia, asthma, iperiasis and melanoma. Zeytori3 proteins are used to enhance fertilisation. Zeytori3 antagonists are used to treat myocarditis, atherosclerosis, pelvic inflammatory diseases (PID), peoriasis, eczema, scleroderma and other inflammatory diseases. Zeytori3 sequences and/or its antibodies are useful for treatment of disorders associated with vasconstriction, heart arrhythmia, congestive heart classase, muscle spasms and fatigue. They are used for detecting human chromablities. Zeytori3 colby are used in gene therapy.

Zeytori3-cytoria-cytoria fusion proteins are useful for enhancing in vivo killing of target tissue. The present are useful for enhancing in vivo killing of target tissue.
                                                                                                                                                                                                                                                                                                  Novel human phosphodiesterase polypeptide, zcytor13 and polynucleotide encoding it, for detecting human chromosomal abnormalities, identifying modulators and treating inflammatory and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                are useful for enhancing in vivo killing of target tissue. The present sequence is a polyA PCR primer, 2C7764b which is used to isolate full length zcytor13 cDNA by screening human placental cDNA library
                                                                                                                                                                                                                                                                                                                                                                                     Example 1C; Page 118; 122pp; English.

The invention relates to a polynucleotide derived from the 4q12-4q13 region of human chromosome 4 and encoding a zsig63 polypeptide, a secreted salivary protein with anti-microbial activity. Due to their microbial activity, the sequences can be used in the study of microbial infections, e.g. for recombinant production of anti-microbial proteins. The sequences can be used in the treatment of tooth decay, periodontal disease, thrush, gastrointestinal disease, uninary tract infections, vaginal infections, skin infections, epithelial wounds, chronic tissue diamage, acquired immunodeficiency syndrome (AIDS), cystic fibrosis, lung infections, sarcoidosis, emphysema and chronic bronchitis. This sequence represents a sequencing primer for cDNA encoding human zsig63
                                                                                                                                                                                                                                                                            Polynucleotides encoding salivary proteins useful as anti-microbial

Novel secreted salivary protein, zsig63 and polynucleotide encoding it useful for treating microbial infections, inflammatory conditions, dental caries and lung infections associated with cystic fibrosis.

Example 1; Page 29; 33pp; English.

The present invention relates to a new secreted salivary protein, zaig63.

The invention is useful for detecting in a test sample, the presence of
an antagonist or agonist of zaig63 protein activity. The invention is
also useful as an immunogen for proteins an antibody to zaig63
also useful as an immunogen for producing an antibody to zaig63
co polypeptide. zaig63-cytokine fusion proteins or antibody-cytokine fusion
co protein are useful for enhancing in vivo killing of target tissues.

Pharmaceutical composition comprising purified zaig63 polypeptide are
useful in the treatment of conditions associated with pathological
confictors, including bacterial, fungal and viral infections. High
corporates are useful for treatment of dental caries (cooth decay),
confictorial disease, thrush and gastrointestinal disease. Other
copplications can be used in uninary tract infections, vaginal infections,
periodontal disease, thrush and gastrointestinal disease. Other
copplications can be used in uninary tract infections and protect
copplyceptides can be used to establish normal microflora and protect
copplyceptides can be used to establish normal microflora and protect
copplyceptides can be used to establish normal microflora and protect
copplyceptides can be used to establish normal microflora and protect
copplications can be used to establish normal microflora and protect
copplications can be useful as anti-inflammatory agents. The invention is
copplicationly in areas having a limited or damaged vascular system e.g.
copplyceptides may be useful as anti-inflammatory agents. The invention is
conferent for the treatment of patients having incompetent immune system
could as AIDS (acquired immunodeficiency syndrome) patients or individuals
could be a AIDS (acquired immunodeficiency syndrome) patients or individuals
could be present nucleic acid sequence represents a useful for aiding digestion.
The present nucleic acid sequence represents a cyling infections of zsig63
in the methods of the invention for identification of zsig63

```
The invention relates to human secreted salivary polypeptide designated as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63 can be used in detecting agonists and antagonists of its activity, and is also useful as a host defense polypeptide, immune modulating factor, antipathogenic polypeptide, cell-signalling molecule, growth factor, cytokine, or as secreted extracellular matrix associated proteins with growth factor hormone activity. It is useful for treating conditions associated with pathological microbes, including bacterial, fungal and viral infections, for treating dental carries (tooth decay), periodontal cification, vaginal infection and for preventing infection in skin and other epithelial wounds. zsig63 is useful for establishing normal currenting chronic tissue damage e.g. damage in extremities associated with cidabetes and useful as anti-inflammacory agents. It is useful as a marker of lung dysfunction, salivary gland dysfunction, or dysfunction of propeated gland. It is also therapeutically useful for aiding digestion. Polymucleotides of the invention are used in gene therapy for increasing or inhibiting zsig63 activity, for detecting abnormalities on human chromatoms. Subsociated with disease or other human traits and as diagnostics in forensic DNA profiling. Sequences of the invention are used diagnostics in forensic DNA profiling. Sequences of the invention are used the invention of diapocytes and for shrinking relation or differentiation of adapocytes and for invity in the mycoytes and set in shrinking relation or differentiation of adapocytes and for invity in the mycoytes and set in the profileration or differentiation of adapocytes and for invity in the disease or other human traits and as marker when the mycoytes and set in the profileration or differentiation of adapocytes and for increasing the mycoytes and set in the part of the profileration or differentiation or differentiation or differentiation or differentiation or differentiation or differentiation or differenti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present sequence is a primer used in the identification of human zsig63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel secreted salivary polypeptide, zsig63, useful as antimicrobial agent for treating microbial infection, dental carries, periodontal disease, thrush gastrointestinal disease, and for aiding digestion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inhibiting chondrosarcomas, atherosclerosis, restenosis and

New zalphall ligand polypeptides and polynucleotides, useful for stimulating proliferation, activation, differentiation and/or induction of inhibition of specialized cell function, or for stimulating an antigenic response

Example 7; Col 139; 105pp; English.

calphall Ligand and the polymucleotide encoding it. The invertion also gives the sequence for the zalphall receptor and the polymucleotide encoding it. The zalphall Ligand polypeptide stimulates proliferation of encoding it. The zalphall Ligand polypeptide stimulates proliferation of natural killer (NK) cells or NK cells, proliferation of B-cells stimulated with anti-cells, proliferation of T-cells, proliferation of B-cells stimulated with anti-ceduces proliferation of B-cells stimulated with anti-ligh antibodies. The zalphall Ligand polypeptide is also useful in preparing antibodies that bind to zalphall Ligand epitopes. The zalphall Ligand polymucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the infusion of donor lymphocytes, and to a sequence or stimulate the infusion of donor lymphocytes, and to a sequence control properson of a sequence represents present invention relates to the isolation of a novel cytokine,

The invention relates to an isolated zeig63 polypeptide comprises domain 3, mature zeig63 and full length zeig3. Also zeig63, domain 3, mature zeig63 and full length zeig3. Also included are the polyuncleotide encoding zeig63, a zeig63 expression controlled are the polyuncleotide encoding zeig63, a zeig63 expression included are the polyuncleotide encoding zeig63, a zeig63 expression comprising the vector and expression the protein (comprising amino acids 1-15, 18-37, 38-22, 127-219 or 16-219 of zeig63 and an additional protein, using a carging sene construct to identify zeig63 agonists, and producing an anti-zeig63 antibody using zeig63 immunogenic peptides, zeig63 is natioody using zeig63 immunogenic peptides, zeig63 is carging protein activity. Zeig63 has antimicrobal accivity, and since exhibits high expression in sallvary gland, can be used for treating dental carries, periodontal disease, thrush, and gaatrointestinal disease, uninary tract infections, vajanal infections, seig63 is and other epithelial wounds. The polypeptides can be used to establish cornal infections and protect against pathogenic colonization and other epithelial sounds. The polypeptides can be used to retablish cornal infections and protect against pathogenic colonization and crowing chronic, tissue damage particularly in areas having limited invasion. Zeig63 can also be used for providing pro-inflammatory activity for treating chronic, tissue damage particularly in areas having limited chemotherapy, radiation treatment, for treating lung infections e.g. in cystic fibrosis. Detection of zeig63 is polypeptides ar relatively high conditions associated with sallvary gland carcinoma, headen any indicate that such polypeptides may be used to replace serum that is commonly used in the traches may indicate that such polypeptides may be used to replace serum that is commonly used in culture media and may be used to replace serum that is commonly and encoding human zeig63 activity, and for detecting abnormalities on human zeig63 primer used to 
                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated zsig63 polypeptide, member of the adhesin family, useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 26 BP; 1 A; 0 C; 0 G; 25 T; 0 U; 0 Other;

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset candidate polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in them agence, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOUS; Rep.X; human; genetic disease; drug-treatment; Machado-Joseph; Haw River syndrome; Huntington's disease; fragles x syndrome; Predreich's ataxis; myotonic dystrophy; hyperandrogenaemia; spinal atrophy; bulbar atrophy; spinocerebellar ataxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

New antisense oligonucleotides targeted to nucleic acids encoding thyroid hormone receptor interactor 6, useful for diagnosing or treating hyperproliferative disorders, such as cancer.
                                                                                                                                                                                                                                                                                                                            The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactor 6 (TRIP6) to inhibit its expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (ZRP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 and for treating diseases or conditions associated with the expression of TRIP6 such as hyperproliferative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as tresearch reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is human TRIP6 DNA specific PCR primer, used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein inhibiting apoptosis, useful in the diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nck associated protein 1; Nap1; human; apoptosis; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primer for human Nck associated protein 1 coding sequence.

The invention relates to sequence determination oligonucleotides for detecting polymorphic sites in a 5' flanking region of cytochrome P450 2D6 (CYP2D6) gene. CYP2D6 enzymes are involved in the metabolism of many different xenobiotics. Human CYP2D6 gene is located on chromosome 22. The oligonucleotides may be used as in situ hybridisation probes, in ligase-based sequenced determination, as components of diagnostic assays, as probes in sequence determination methods based on mismatches, as hybridisation-based diagnostic assays, and as components of diagnostic microarray. CYP2D6 is useful to predict variations in an individual's ability to metabolise certain drugs. The present sequence is a sense oligonucleotide used for detecting of human CYP2D6 gene 5' flanking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, cytochrome P450 2D6; CYP2D6; enzyme; detection; xenobiotic;

Generating mutation in gene using cells which contain defective mismatch repair gene, useful to generate genetically altered mutations with new output traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The patent discloses a method for generating hypermutable organisms. Dominant negative alleles of human mismatch repair genes can be used to generate hypermutable cells and organisms. They increase the rate of spontaneous mutations by reducing the effectiveness of DNA repair and thereby render the cells or animals hypermutable. The method is used to produce genetically altered organisms to produce new output traits. The present sequence is a bacterial poly purine nucleotide phosphorylasse (polypwPP) DNA fragment containing an in-frame polyA tract. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                   Hypermutable organism; dominant negative allele; mismatch repair gene; spontaneous mutation; DNA repair; purine nucleotide phosphorylase; PNP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Grasso L, Vogelstein B, Kinzler KW;

The invention relates to systems for identification and characterisation of gene expression in one or more samples, comprising an identimer having a specific oligo-dT primer sequence, where the identimer comprises a categoristic oligo-dT primer sequence, where the identimer comprises a categorist cast the relative differences in mRNA between 2 or more samples, where differences in mRNA between 2 or more samples, where captered, for supporting discovery of new genes, and for identifying mRNAs that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising compositions and systems that incorporate new strategies where molecular or biochemical assay compositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene corpositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene corposition and the following advantages over existing methods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence in formation and differences in mRNA level, to determine mRNA expression laborates cDNA fragments from all mRNAs present in the sample for subsequent investigation by common molecular biology contenting subsequent investigation by common molecular biology contenting allowing advantages or differences of the genome of the organism under investigation and can be employed in consequence represents an oligo off primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying and characterizing gene expression in samples, for identifying markha expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end.

```
Generating mutation in gene using cells which contain defective mismatch repair gene, useful to generate genetically altered mutations with new output traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses a method for generating hypermutable organisms. Dominant negative alleles of human mismatch repair genes can be used to generate hypermutable cells and organisms. They increase the rate of spontaneous mutations by reducing the effectiveness of DNA repair and thereby render the cells or animals hypermutable. The method is used to produce genetically altered organisms to produce new output traits. The present sequence is a bacterial poly purine nucleotide phosphorylase (polyPNP) DNA fragment containing an out-of-frame polyA tract. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dominant negative allele; mismatch repair gene; D-MMR; gene discovery; ITRE; inducible transcriptional regulatory element; recombinant gene mutagenesis; recombinant protein production; drug target discovery; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel contiguous and partially overlapping cDNA sequences and their encoded polypeptides, designated PA153, transcribed from human pancreatic tissue and which have cytostatic activity. The PA153 polynucleotides, proteins and antibodies are all useful in methods of detection. Detection of PA153 polynucleotide, antigens or anti-PA153 antibodies in a sample is indicative of pancreatic disease. PA153 antibodies (antagonists) can also be used in vivo for therapeutic use, e.g. treatment of pancreatic disease, tumours or metastases. Antisense PA153 polynucleotides can be used in gene therapy of pancreatic diseases. AAX78712-X78725 represent primers used in the method of the invention

                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preparation of normalised, subdivided cDNA libraries from mRNA - by reverse transcription and amplification, used to screen for new genes and interacting proteins, potential drugs, and for diagnosis.
                                                                                                                                                                     The invention relates to methods for generating a mutation in a gene of interesting using a dominant negative allele of a mismatch repair gene (D-MMR) under control of an inducible transcriptional regulatory element (TTRE). The invention is useful to provide new call lines that can be used for gene discovery, drug target discovery, recombinant gene mutagenesis or recombinant protein production. The present sequence is a polyPNP (purine phosphorylase) out-of-frame polyA tract DNA
                                                                                  Generating a mutation in a gene using a dominant negative allele of a mismatch repair gene which results in mismatch repair deficiency in ce containing the allele is useful in gene and drug target discovery and

                                                                                                                                                                                                                                                                                                                                                                     g
```

The invention relates to preparation of a normalised, subdivided library of amplified cDNA from the coding regions of mRNA in a sample. The method

```
involves reverse transcription, with at least one cDNA primer of formula 5'-Conl-dTn2-Vn3-Nn4 to form first stand cDNA where Conl = any sequence of 1-100 nucleotides; dT = deoxythymidinyl; n2 is at least 1; n3 and n4 are both 0, or n3 is 1 and n4 is at least 1; followed by second strand con both 0, or n3 is 1 and n4 is at least 1; followed by second strand primer of a similar formula, in the presence of DNA polymerase I (or its Klenow fragment) and amplification of double-stranded cDNA with a set of atsabase (a computer-generated list of molecular weights of restricted DNA fragments of known sequence) is used to determine presence of an expressed protein in a cell, also to detect changes in such expression (particularly for diagnosis of disease). Surfaces (chip) having amplified CDNA stably immobilised on it, obtained by a similar method, are used to screen for genes of a particular family, by hybridisation with nucleic conditions the first of disease). Surfaces (chip) having amplified con the family (coidentify new genes) and to detect differences in expression patterns between cells. The polypeptides expressed by the control of the ford of the control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of peptide-based transcript or genetic analysis comprising: (a) providing multiple polynucleotides (I) derived from mRNAs from a biological sample, where (I) has homology to a known reference sequence (II); (b) expressing (I); and (c) assessing a physical property of the expression products to determine the sequences of (I) by comparison with the predicted properties of polypeptides encoded by (II). The method is useful for transcript or genetic analysis, especially nucleic acid analysis where the method comprises expressing polypeptides from two or more reading frames and determining the masses to create a peptide mass signature characteristic of the nucleic acid molecule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAS1174
```

peptide is considerably smaller than the DNA molecule that encodes it (individual amino acids averages about 110 Daltons each whereas the trinucleorides (triplets) that encode them average N Daltons each). Also, the peptides are much more diverse in composition than nucleic acids, as they are composed of combinations of 20 different amino acids instead of combinations of 4 different nucleotides, e.g., two random DNA fragments of identical composition (e.g., with 10 adenines, 10 thymines, 15 guanines, and 15 cytosines) are extremely unlikely to encode peptides of identical composition. This means that whereas the two nucleic acids have identical masses and cannot be distinguished on the basis of mass, the peptides that they encode will, except in statistically very rare cases, have different masses and can be readily distinguished in the basis of mass. The present sequence represents the coding sequence of human haemoglobin alpha 2 transcript (extreme 3' end) used in an example to demonstrate the method of the invention

An isolated polypeptide with aminopeptidase activity, for preparing food compositions, such as bread and cheese, with enhanced flavoring.

Example 5; Page 40; 94pp; English.

The invention relates to an isolated polypeptide with aminopeptidase activity and the gene encoding it (including sequences complimentary to the gene and which hybridise to it at high stringency). From Appergillus niger. Also included are a nucleic acid construct comprising the above polynucleotide operably linked to one or more control sequences that direct the production of the polypeptide in a suitable expression host, a recombinant expression vector comprising the above nucleic acid construct, a recombinant host cell comprising the above construct or vector, and producing the protein comprising cultivating an above strain/recombinant host cell to produce a supernatant and/or cells comprising the polypeptide and recovering the polypeptide. The aminopeptidase is used to prepare a food composition such as dough to enhance the flavour

ö of. a baked product from the dough and for preparing a cheese to enhance the flavour. The invention provides a bacterial enzyme for protein hydrolysis i.e. with aminopeptidase activity, to produce flavouring agents, and the enzyme has been isolated ancharacterised, compared to previously observed weak aminopeptidase activity which was detected in an Aspergillus niger culture filtrate but the source was never isolated or identified. The use of enzymes to produce flavouring agents from proteinaceous material is better than use of strong acids which can severely degrade the amino acids obtained. The present sequence is a reverse transcriptase (RT)-PCR primer used to investigate the intron-exon Gaps ö Match 1.2%; Score 20.6; DB 1; Length 24; Local Similarity 91.3%; Pred. Polynucleotides encoding salivary proteins useful as anti-microbial agents.

Example 1; Col 53; 29pp; English.

The invention relates to a polynucleotide derived from the 4q12-4q13 region of human chromosome 4 and encoding a zaj653 polypeptide, a secreted aalivary protein with anti-microbial activity. Due to their microbial activity, the sequences can be used in the study of microbial infections, e.g. for recombinant production of anti-microbial proteins. The sequences can be used in the treatment of tooth decay, periodontal disease, thrush, gastrointestinal disease, uninary tract infections, vaginal infections, skin infections, epithelial wounds, chronic tissue damage, acquired immunodeficiency syndrome (AIDS), cystic fibrosis, lung infections, sarcoidosis, emphysema and chronic bronchitis. This sequence represents a sequencing primer for cDNA encoding human zsig63

Adler DA, Sheppard PO;

WPI; 2002-642378/69.

Novel secreted salivary polypeptide, zsig63, useful as antimicrobial agent for treating microbial infection, dental carries, periodontal disease, thrush gastrointestinal disease, and for aiding digestion.

Example 1; Page 29; 33pp; English.

The invention relates to human secreted salivary polypeptide designated as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63 can be used in detecting agonists and antagonists of its activity, and is also useful as a host defense polypeptide, immune modulating factor, antipathogenic polypeptide, cell-cell signalling molecule, growth factor, cytckine, or as secreted extracellular matrix associated proteins with growth factor hormone activity. It is useful for treating conditions

```
disease, thrush and gastrointestinal disease, for treating, fungal and disease, thrush and gastrointestinal disease, for treating urinary tract infection, vaginal infection and for preventing infection in skin and other epithelial wounds. Zsig63 is useful for establishing normal and protect against pathogenic colonisation and invasion, for treating chronic tissue damage e.g. damage in extremities associated with diabetes and useful as anti-inflammatory agents. It is useful as a marker of lung dysfunction, salivary gland dysfunction, or dysfunction of prostate gland. It is also therapeutically useful for aiding disestion. Polymucleotides of the invention are used in gene therapy for increasing or inhibiting zsig63 activity, for detecting abnormalities on human chromosome 4 associated with disease or other human traits and as diagnostics in forensic DNA profiling. Sequences of the invention are useful for stimulating proliferation or differentiation of cardiac myocytes, for proliferation or differentiation of adipocytes and for inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The present sequence is a primer used in the identification of human zsig63 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The RNA when introduced into susceptible host cells, induces the generation of infectious BVDV particles. The attenuated BVDV clone or strain is useful in the manufacture of a vaccine for the prophylaxis and treatment of BVDV infections. The invention is useful in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA molecule useful for manufacturing a vaccine for the prophylaxis treatment of Bovine Viral Diarrhea Virus (BVDV) infections, comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated zsig63 polypeptide comprising at least 90% identity to an amino acid sequence which comprises domain 1 of zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also included are the polymucleotide encoding zsig63, a zsig63 expression vector, a cultured cell comprising the vector and expressing the protein, a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-126, 127-219 or 16-219 of zsig63 and an additional protein), using a matu-zsig63 antibody using zsig63 immorgenic peptides, zsig63 is useful for detecting in a test sample, the presence of antagonist of zsig63 protein activity. Zsig63 has antimicrobial activity and since exhibits high expression in salivary gland, can be used for treating dental carries, periodontal disease, thrush, and gastrointestinal disease, urinary tract infections, vaginal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated zsig63 polypeptide, member of the adhesin family, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, skin infections.
is a PCR primer used to amplify BVDV gene. (Updated on 27-OCT-2003 to standardise OS field)

normal microfilora and protect against pathogenic colonization and invasion. Zsig63 can also be used for providing pro-inflammatory activity invasion. Zsig63 can also be used for providing pro-inflammatory activity for treating offronic, tissue damage particularly in areas having limited or damaged vascular system, e.g. in diabetes, and for treating limited or confidence and for treating limited or immunocompromised AIDS patients or in individuals that have undergone confidence and and and properties are at a section of casigas polypeptides that have undergone confidence in the trachem may indicate that such polypeptides may serve as a marker of lung dysfunction. Zsig63 is also useful in diagnosing conditions associated with salivary gland or lung dysfunction including salivary gland carcinom. Pneumocystis carinii infection, emphysema, chronic bronchitis, prostate dysfunctions such as prostate adenocarcinoma, aiding digestion, and as components of defined cell culture media and may be used to replace serum that is commonly used in culture. The DNA is useful in gene therapy applications to increase or inhibit zsig63 activity, and for detecting abnormalities on human cultume. The DNA is useful in gene therapy applications to increase or inhibit zsig63 activity, and for detecting abnormalities on human conformation dentin dysplasia type II). Zsig63 is an adhesin family member. The present sequence is a primer used to isolate and sequence nucleic acdis encoding human zsig63 other epithelial wounds. The polypeptides can be used to establish

reaction.

The invention relates to producing a population of double-stranded product DNA molecules comprising amplification by a nested PCR method. The method is useful in profiling mRNA transcribed in a system under investigation. The oligonucleotides are used as size standards in

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCB) or its variant, operably linked to a promoter that drives expression of heterologous sccor its variant in skin. The product of the invention is useful as a model or its variant in skin. The product of the invention is useful as a model or a study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal compound or compositions of example inflammation, dermal inflammation, pruritus, atopic dermatitis, eczema, acce and inherited skin diseases with epidermal hyperkeratosis. The mechanisms and the testing of each of the mechanisms and the testing of each of the compound or composition of the mechanisms and the testing of the composition of the composition of the mechanisms and the testing of the composition of the composition of the mechanisms and the testing of the composition ö heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin. potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents a 5' RACE cDNA synthesis primer used in a method of detecting homologues to human stratum corneum chymotryptic enzyme, SCCE, gene. SCCE is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Coxeackie virus strain VD2921; diabetogenic coxeackie B virus-4; CBV-4; strain VD2921; VP1; VP2; VP3; VP4; P2A; P2B; P2C; P3A; P3B; P3C; P3D; diabetes; diabetogenic enterovirus; beta cell loss; blindness; renal fallure; leg amputation; PCR; primer; ss.

This sequence was used to determine whether 2-5A-antisense chimeric molecules are inhibitory to cell growth. The molecules AAQ64709, AAQ64711 and AAQ64724 all lacked cytotoxicity. In the novel 2-5A-antisense oligonuclectide chimeric molecules, the antisense region targets the chimeric molecule to a particular region of RNA to be specifically clasved and the 2',5'-linked terraadenylate tail activates the 2-5A RNase. Typical applications are treatment of viral infections (esp. cleavage of an RNA virus genome), cancer; leukaemia, cardiovascular disorders (e.g. restenosis after angloplasty), genetic disorders, osteoarthritis or rheumatoid arthritis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Specific cleavage of RNA, useful partic. for treating viral infection, cancers, etc. - by using anti-sense oligo:nucleotide coupled to activator of 2-5A dependent RNase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to DNA for a promoter and an L1 cassette sequence having a core retrotransposon element. The invention is useful for random insertion of a heterologous or homologous DNA sequence into a cell genome, and for correction of a genetic defect in the cell into which the insertion is made. Genetic defects which may be corrected includes cystic fibrosis, mutations in the dystrophin gene, genetic defects associated with blood clotting and other genetic defects

ph with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human intranslated sequence contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B. herpes, malidonal trumcurs and inflammation. The triple the subjecting the test specific DNA two assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (mucleotides have the 3/positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additions may render the collower stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                              The synthetic oligomer is capable of forming a triplex at physiological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 23 BP; 2 A; 0 C; 0 G; 21 T; 0 U; 0 Other;

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human interleukin 6 gene untranslated sequence contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are
                                                                                                                                                                                                                                         Human interleukin-6 gene; herpes simplex; AIDS; modified; HIV; RSV; HPV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New oligomers contg. modified bases - which form a triplex with G-C doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis, herpes malignancy and inflammation.

ö
useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (nucleotides have the 3'positions of xylose sugars linked via the o-xylone tring). Two nucleotides are coupled through a xylone residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, cDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detaching nucleic acid molecule comprising unconventional nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                        Detaching nucleic acid molecule comprising unconventional nucleotide incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, cDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used
                                                                                                                                                                                                                 Nucleic acid cleavage; solid support; affinity chromatography; sequencing; mutagenesis; DNA preparation; nucleic acid purification; se

The present invention describes a variant human MLH1 or MSH2 gene. Also described are: (1) a method for diagnosing or predicting susceptibility to hereditary non-polyposis colorectal cancer (HNPCC), comprising screening a DNA sample for the variant MLH1 or MSH2 gene where presence of the variant indicates presence of, or susceptibility to HNPCC; (2) a method of identifying mutants in splice donor or acceptor sites of a human MLH1 gene, comprising sequencing splice donor or acceptor sites of the genewith intronic primers for the human MLH1 gene and analysing the sequence to identify any mutants; (3) a method of identifying mutants in splice donor or acceptor sites of the gene with intronic primers for the human MSH2 gene and analysing the sequence to identify any mutants; and (4) a transgenic model system for colorectal cancer comprising cells expressing the variant MLH1 or MSH2 gene. The hMLH1 and hMSH2 variants are used to diagnose or determine a patients

OND ABL01745 and ABL01746 to ABL01831 represent hMLH1 and hMSH2 gene or the present invention mutagenic primers used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PUR element; human; c-myc; inhibitor; hyperproliferative disease; ss; cancer; probe; hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New variants of the human MLH1 and MSH2 genes for diagnosing or determining a predisposition for hereditary non-polyposis colorectal
Human, MLH1; MSH2; hMLH1; hMSH2; variant gene; diagnosis; HNPCC;
hereditary non-polyposis colorectal cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            POLYA, a competitor oligonucleotide for binding human PUR-alpha.

The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR gene. The present sequence represents an oligonucleotide used in the cloning and sequencing of the PUR protein and its sequence element PUR repeat, in an example from the present invention
                                 This is the nucleotide sequence of an oligonucleotide used as a competitor with the PUR element in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases such as cancer
                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                     The oligonucleotides AAT99279-T99286 were used as competitor oligonucleotides for the binding of PUR prtein to DNA. The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may be used to treat hyperproliferative diseases such as cancer
                                                                                                                                                                                                                                                                                                                                        Assays for PUR protein ligands or modulators - using immobilised PUR protein or fragments, to treat hyper-proliferative diseases, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PUR protein and its fragments - that inhibit PUR protein binding to PUR element or other proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method (MI) for inserting a nucleic acid (NI) into a circular vector (VI) comprising joining ends of NI and VI under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or CDNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly representative libraries to be made. Vector to vector ligation is avoided using the methods. AAA40351-A40366 represents primers used to illustrate

This invention describes a novel method (M1) for inserting a nucleic acid (M1) into a circular vector (V1) comprising joining ends of N1 and V1 under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or cDNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly representative libraries to be made. Vector to vector ligation is avoided using the methods. AAA40351-A40366 represents primers used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection, bacterial infection; fungal infection; parasitic infection; cancer; asthma, infectious disease; allergy, immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inserting a nucleic acid into a circular vector comprising joining their ends, melting, and reannealing ends at two different concentrations, useful for cloning small amounts of nucleic acids and forming genomic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                       response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an inucleic acid. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine or nucleic acids can be pyrimidine or (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects addlar unique antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. herpesviridae) acids can continuous amongolobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thz to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; tungal infection; parasitic infection; cancer; asthma; infection; parasitic infection; cancer; asthma; and infections disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                                                Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to a method for stimulating an immune response. The method comprises administaring an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (r) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Bscherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a filt to a Thi immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           anti-parasitic;
Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasi

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae) haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parastic antigens. The method is staphylococcus), fungal antigens and/or parastic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer. Claim 1; Page 2483; 11750pp; English.

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV65213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; d) assessing the efficacy the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient;

```
ö
(f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                         Anglogenesis inhibitor; ss; anglogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial anglogenesis; bladue neovascularisation; telangiectasia; haemophiliac joint; anglofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.

Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted anglogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, theumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprising
                                                                                                                                                                                                                                                                                                                                                                                                      tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiactasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    wound granulation, intestinal adhesions, atheroscierosis, scleroderma hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention

```
nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with soild tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         administering at least one antiangiogenic nucleic acid molecule. Also
included is a kit comprising a first container housing the antiangiogenic
                                                                                                                                                                                                         tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasis; rubeosis; osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                           Angiogenesis inhibitor; ss; angiogenesis; solid tumour growth;

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of cancer, involving administering to a subject having or at risk of of eveloping cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx cancer, leukaemia, liver cancer, lung cancer, kidney cancer, larynx cancer, pancreatic cancer, prostate cancer, rabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, rabdomyosarcoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the

```
The invention relates to the detection of multiple components in a medium, comprising combining the medium with at least two sensitiser reagents one reactive reagent extivated by a product generated by the sensitiser reagents when activated and differentially activated by the sensitiser reagents. The combination of sensitiser cannot be components and reactive reagents (s) allows differential detection of the components. Methods of the invention may be used for the detection of ligands, receptors and polymoclecides, and also for the detection of c ligands, receptors and polymoclecides, and also for the detection of byhaholys, phosphate esters, thiophosphates, carbamates and collyhalogenated sulfenanides) and pollutents. Methods of the invention allow the detection of multiple analytes in a single test medium. An application of the methods of the present invention would be in the field of calinical diagnostics. The current sequence represents A24 oligonucleotide for the creation of oligonucleotide coated phthalocyanine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection of multiple analytes, e.g. ligands, receptors, polynucleotides and pollutants, involves adding a combination of sensitizer reagents and reactive reagent Actuatable by a product of the sensitizer reagents.

The present invention provides the protein and coding sequences of human phosphatidylinositol-3 (PTDINS-3) kinase 35. The sequences can be used in the treatment of cancer, haemopathy, HIV infection, development disorders, immunological diseases and inflammation. The present sequence is a PCR primer for the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphism detection; sequence detection; mutation detection; A24; probe; non-dissociative termolecular complex; dopTAR sensitiser particle; single nucleotide polymorphism; SNP; ss.
                                                                                                                                                                                                                  New human phosphatidylinositol-3 (PTDINS3) kinase 35 for diagnosing and treating malignant tumor, hemopathy, human immunodeficiency virus infection, immunological diseases and various inflammations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A24 oligonucleotide used to create dopTAR chemiluminescer particles

This invention represents a method for detecting the presence of a polynucleotide sequence, differences in polynucleotide sequences or mutations in genomic DNA. The method involves contacting 3 oligomucleotide probes with a sample containing a polynucleotide. The first probe hybridises to a region of the polynucleotide sequence and the second and third probes can bind a second region of the polynucleotide conference of one or more nucleotides. The reaction medium is presence or difference of one or more nucleotides. The reaction medium is them subjected to conditions for forming substantially non-dissociative termolecular complexes, which can be at least one of, the polynucleotide sequence with the first and third probes. The oligomucleotide probes have labels on on-covalantly bound to allow for their detection upon binding. The mon-covalantly bound to allow for their detecting the presence of a single nucleotide polymorphism (SNP) in a fragment of genomic DNA. The method can be used for the direct detection of nucleic acid in very small can be used for the direct detection of nucleic acid in very small containties without amplification. In addition, the method may be carried out with amplification of the target and reference sequences. This sequence represents an oligomucleotide probe A24 used to create dopTAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

ulcer comprising administering a nucleic acid to a subject in need for treatment of gastric ulcer. A nucleic acid sample comprising oil gonucleotide 2006 was administered to a mouse model by an oral route or a vehicle control. Colonisation of mice by Heliobacter pylori was assessed at time points from 1 day to 1 month after treatment. The ability of the nucleic acid to reduce H. pylori colonisation was assessed. The method is useful for preventing or treating a gastric ulcer on a subject e.g. human or non-human vertebrate animal including dog, rabbit, turkey, chicken, primate, rat and mouse. The method effectively treats or prevents gastric ulcers. The present sequence represents an immunostimulatory nucleic acid for the treatment of gastric ulcers Prevention or treatment of gastric ulcer involves administering nucleic The invention relates to a method of prevention or treatment of gastric Gaps ö cch 1.2%; Score 20.4; DB 1; Length 24; al Similarity 95.5%; Pred. repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenesmia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                  The invention discloses a method for identifying a candidate polymorphic

The present invention describes immunostimulatory nucleic acids of 14-100 nucleotides in length comprising the formula 5' XIDCGHX2 3' (I) where XI or XZ = independently any sequence 0-10 nucleotides D = nucleotide other than C; C = Cytosine; G = guanine; H = nucleotide other than G; The immunostimulatory nucleic acid further comprises a sequence consisting of pand N positioned immediately 5' to X1 or 3' to X2 and N is a B cell neutralising sequence, where N begins with a CGC trinucleotide and is at least 10 nucleotides long and P is GC-rich palindrome containing sequence at least 10 nucleotides long Also described: (I) a pharmaceutical composition comprising the immunostimulatory nucleic acid and a carrier; and (2) treating an alergic condition. (I) has antiallergic activity and CC can be used in gene therapy. (I) can be used for preparing a composition of a variety of immune related disorders such as cancer, infectious diseases and allergic disorders. (I) also stimulates the contraining activation of instural killer cells and the production of type interventing and activation of type interventing a composition of type interventing and allergic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Improved polymerase thermocycling reaction for nucleic acid amplification, by thermal cycling of promoter-linked nucleic acid template synthesis and in vitro transcriptional amplification of nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                 interferon (\mbox{IFN}). The present sequence represents an immunostimulatory oligonucleotide, which is used in an example from the present invention
                                      New immunostimulatory nucleic acid, useful for preparing a composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an improved polymerase thermocycling reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; PCR; RT-PCR; primer; reverse transcriptase PCR; antisense therapy; mRNA expression profile; promoter containing primer.

containing the annual of nucleic acid sequences, involves denaturing a number of nucleic acid templates [1], combining the annual of nucleic acid templates [1], combining the containing brimer [P2], a primer [P2], a number of deoxynucleotide triphosphates and ribonucleotide triphosphates and ribonucleotide triphosphates and ribonucleotide triphosphates and reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA polymerase, contacting PU with [1] to generate a number of promoter-containing templates; contacting PU with [1] to generate a number of promoter-containing double-stranded nucleic acid templates to form a number of containing double-stranded nucleic acid templates to form a number of containing double-stranded DNA templates to form a number of containing double-stranded DNA templates, and thus for producting the method is useful for flugroved polymerase thermocycling reaction for limprove profile of a cell by M1 to generate multiple copies of the mRNA, millial a diseased state, by generating an expression profile of the cells in both normal and diseased state, and the cells in both normal and diseased state, and the cells in both normal and diseased state, and the cells in mRNA sequences of cell(s) in the containing the differer from mRNA in the substant protein production of the solated mRNA, and contained by aberrant protein prod
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           production of cell in a diseased state by the above method, amplifying the aberrant protein by M1 and using recombinant techniques to determine the effect of proposed drug on the aberrant protein. M1 is also useful for differential screening of tissue-specific gene expression at a cellular level, for preparing labeled RNA/DNA probes for a gene chip technology, and for determining the efficacy of a drug regiment against gene or its cDNAs. The present sequence is an Oligo (dT)24 RT-(reverse transcriptase) PCR primer used to produce first strand cDNA in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of the invention

Synthetic

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contect dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid Treating non-allergic inflammatory diseases, such as psoriasis, ecz allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid. ch 1.2%; Score 20.4; DB 1; Length 24; ll Similarity 95.5%; Pred.                                                                                                                                                                                                              The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psortasis, eczema, allergic context dermattis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

The invention relates to a method of amplification of nucleic acid which comprises primer extension by reverse transcriptase and hybridising an oligomorelectide to the single stranded DNA, where the oligomorelectide is blocked from extension at the 3' and. The method is useful for amplification of nucleic acids. In the new method, a promoter is protected from degradation throughout the method. The promoter is constructed so that it does not serve as a primer for extension of a sequence that is complementary to the target sequence, i.e. it is blocked. The method can be combined with other processes to eliminate the need for multiple steps and varying reaction conditions and their associated problems. At least three otherwise separate enzymatic reactions can occur consecutively in one phase (i.e., without organic extraction and precipitation), more preferably in the same reaction vessel. Preferably, cDNA synthesis according to the new method may occur in a modified low salt buffer. The present sequence represents the poly A tract of a mRNA used to illustrate the method of the invention.
                                                                                                      Amplification of nucleic acids, where the promoter is blocked from extension at the 3' end, useful for eliminating multiple step reactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.2%; Score 20.4; DB 1; Length 24; 95.5%; Pred. The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for disgnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                 Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ds; allergy; asthma; poly-G nucleic acid; aerosol formulation; hypo-responsive subject; immunostimulatory.

The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.

recombination products between two mucleotide sequences. The method comprises combining an initial set of oligonucleotides corresponding to a first nucleotide sequence with a subsequent set of oligonucleotides corresponding to a distinct nucleotide sequence and further combining the initial and subsequent set of combination oligonucleotides having a sequence region corresponding to the initial nucleotide sequence and sequence region corresponding to the sinitial nucleotide sequence and sequence region corresponding to the sicond oligonucleotide sequence. Also described is a method of creating a collection of recombination products between two genes. The methods and compositions of the present invention are useful in the field of synthetic gene technology, and more specifically, to generating a collection of recombination between distinct nucleotide sequences. They can also be used in assembling a library, or a population or a collection of polypeptide
                                                                                                     The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Butterfly biliverdin binding protein BBP-BIX oligonucleotide SEQ ID:106.
Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for creating a collection of

The invention is directed to novel methods of amplifying and detecting DNA using colling circle amplification (RCA). The invention relates to detecting a target sequence (I), which involves using a capture probe (CP) that is complementary to an open circle probe and includes a cleavage site. The method comprises: attaching a capture probe (CP) to a substrate, at both ends, where the CP includes one domain complementary to an OCP (open circle probe) and a second domain that contains a cleavage site (CS), to form a device; treating CP with (I) and OCP for form, a hybridisation complex (HC); treating CP with (I) and OCP for stroularised, forming a second complex (HC2); treating CP with a ligase so that OCP is circularised, forming a second complex (HC2); treating CP with a cleavage agent, to cut at CS, and adding an extension enzyme (EB) and nucleotide triphosphates (NTPs) to form an extended CP, which is detected. The method is used for detecting (I) that comprises two target domains. The method is used for detecting, genotyping and/or quantification of target sequences, for research, clinical use, quality control or field
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detecting nucleic acid targets, useful e.g. for diagnosing single nucleotide polymorphisms, by extension of capture probe complementary to

                             method permits a high level of multiplexing, and since it provides localized product detection, with linear kinetics, is sensitive enough for direct detection and quantitation of unmodified targets. The present sequence is that of a single base extension (SBE) probe used in SNP genotyping with RCA signal amplification to demonstrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotides AAQ95959-82 are examples of oligonucleotides used in a novel method of immobilising oligonucleotides to a solid support by incubating in the presence of a salt or cationic detergent e.g. NaCl (50-250 mW, pH 6.0-8.0) or 1-ethyl-3-(3'-dimethyl amino propyl)-1.3 carbodiimide hydrochloride (ECD). The oligonucleotides can be capture probes for detection of specific nucleic acids by hybridisation or can be primers for template-dependent extension from the immobilised primers on nucleic acid from a target organism. The method can be used in hybridisation assays, sequencing and analysis of genetic polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immobilising synthetic nucleic acid on solid support - by incubation in presence of salt or cationic detergent, for use in hybridisation assays, sequencing and analysis of polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide biotin-T25 for novel nucleic acid immobilisation method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immobilisation; solid support; salt; cationic detergent; capture probe; hybridisation; primer; template-dependent extension; target organism; sequencing; genetic polymorphism; ss.
   testing, particularly detection of single-nucleotide polymorphisms. The
